

Supplementary Figure S5 | Bader mechanism is robust to an independent implementation

Exact decomposition, stability-floor cross-checks and error-reorganization controls on a deliberately stratified 12-system panel.

A, density-dependent basin migration dominates codec, QSQ and spatial-control perturbations; the order-preserving control is heterogeneous. B, changing the basin implementation can shift the absolute numerical floor. C, the independent on-grid implementation reproduces the BaderKit re-derived charge error. D, spatial reorganization has a modest implementation-robust effect.
