

Supplementary Figure S4 | The strictest certified Bader regime is floor-scale, not a universal plateau

Independent QSQ stability floors provide the numerical reference scale; certified compression error increasingly exceeds that scale at looser contracts.

A, frozen error/floor summaries for certified points. B, strict-contract material-level relationship. C, full tight-ladder diagnostic. These data are consistent with an emerging analysis-limited regime at 10^{-4} e but do not establish a universal material-level identity.
