

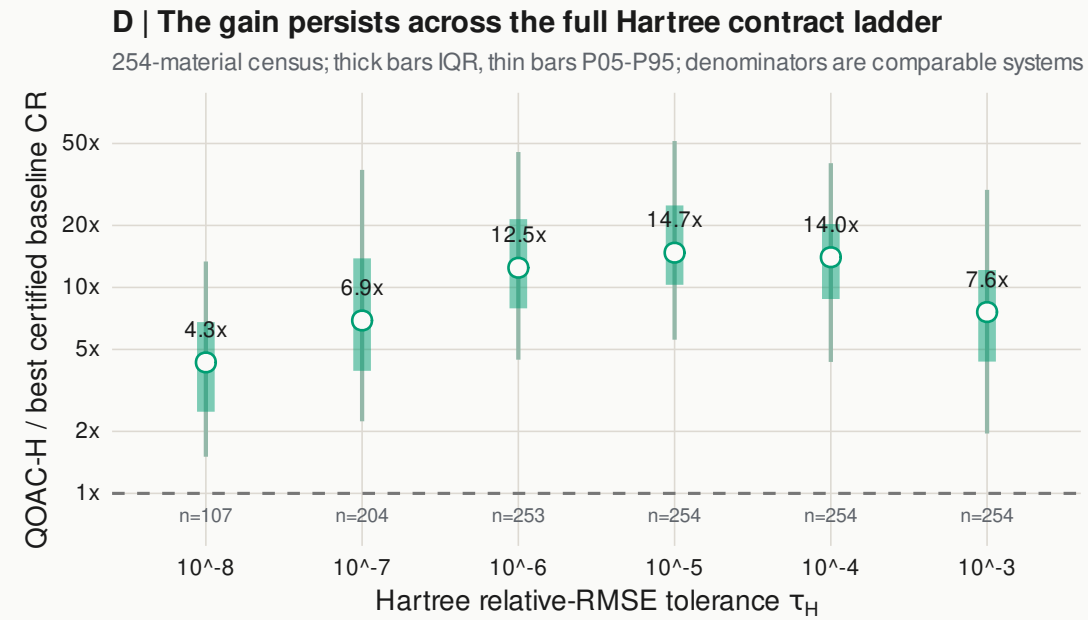

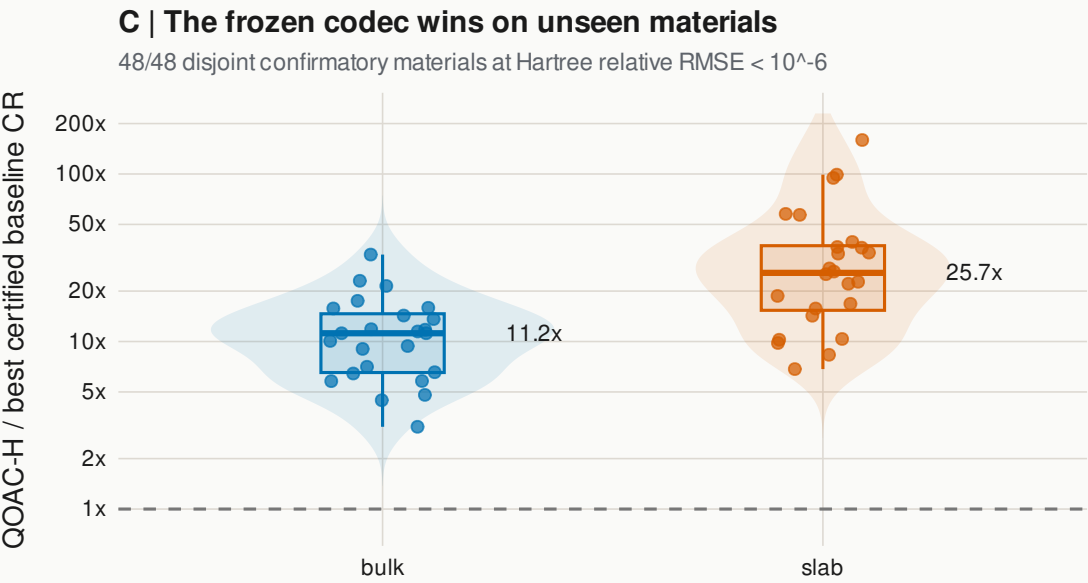

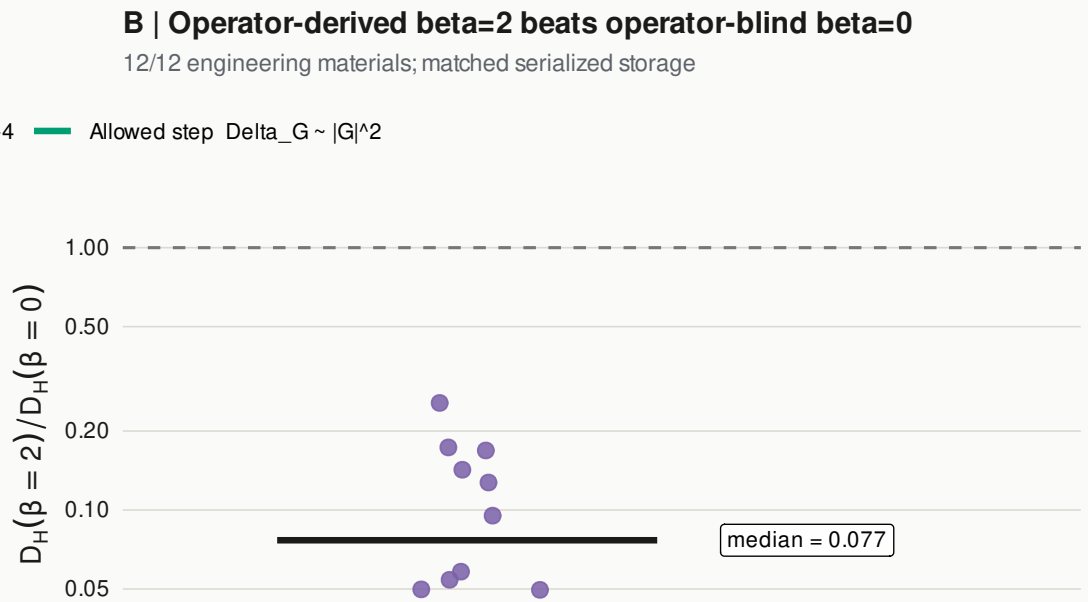

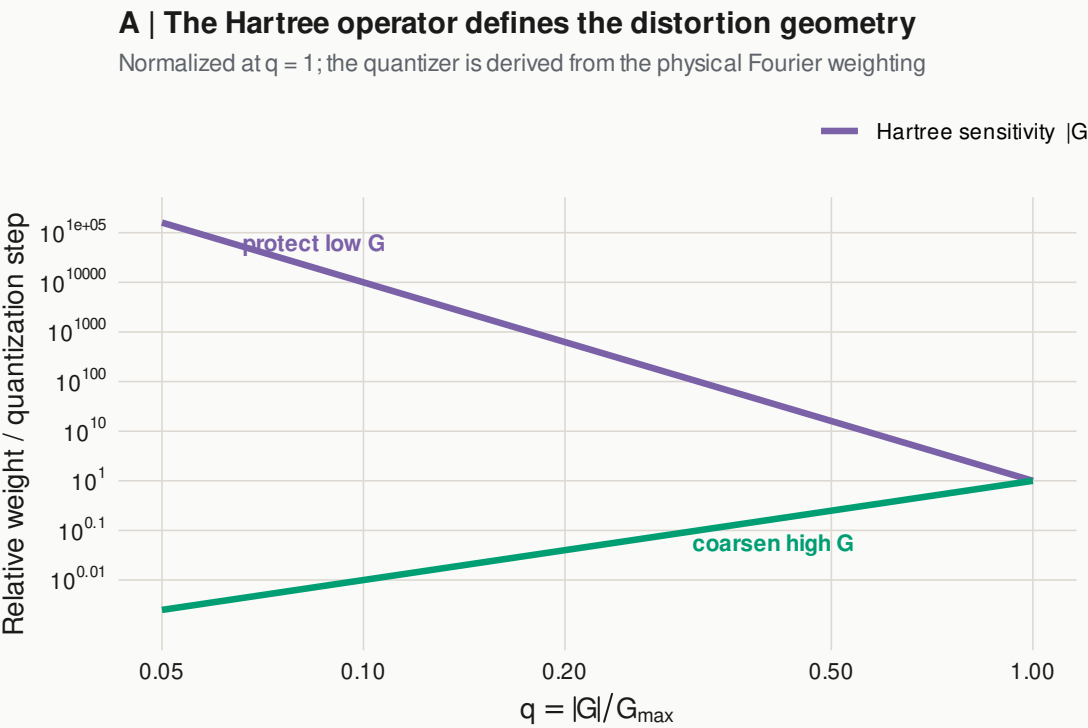

Figure 8 | The downstream operator converts compression diagnosis into design

QOAC-H allocates reciprocal-space error from the Hartree operator, verifies the allocation against an operator-blind ablation, and preserves the gain on a disjoint cohort and the full development population

Primary Hartree contract: relative RMSE $< 10^{-6}$. Confirmatory cohort: 48/48 wins, median CR ratio 15.016x (bootstrap 95% CI 11.204-21.461), with 48/48 Nyquist-safe guardrails passed. Full census at 10^{-6} : 253/253 comparable wins, median 12.4x
