

Supplementary Figure S1 | Protocol A.1 redefines the measurable Bader-fidelity landscape

The archived order-preserving float32 round trip is retained only as provenance; all current eligibility and certification use Protocol A.1.

A | The archived probe systematically understates Bader instability. B | Eligibility changes materially when the relevant failure channel is

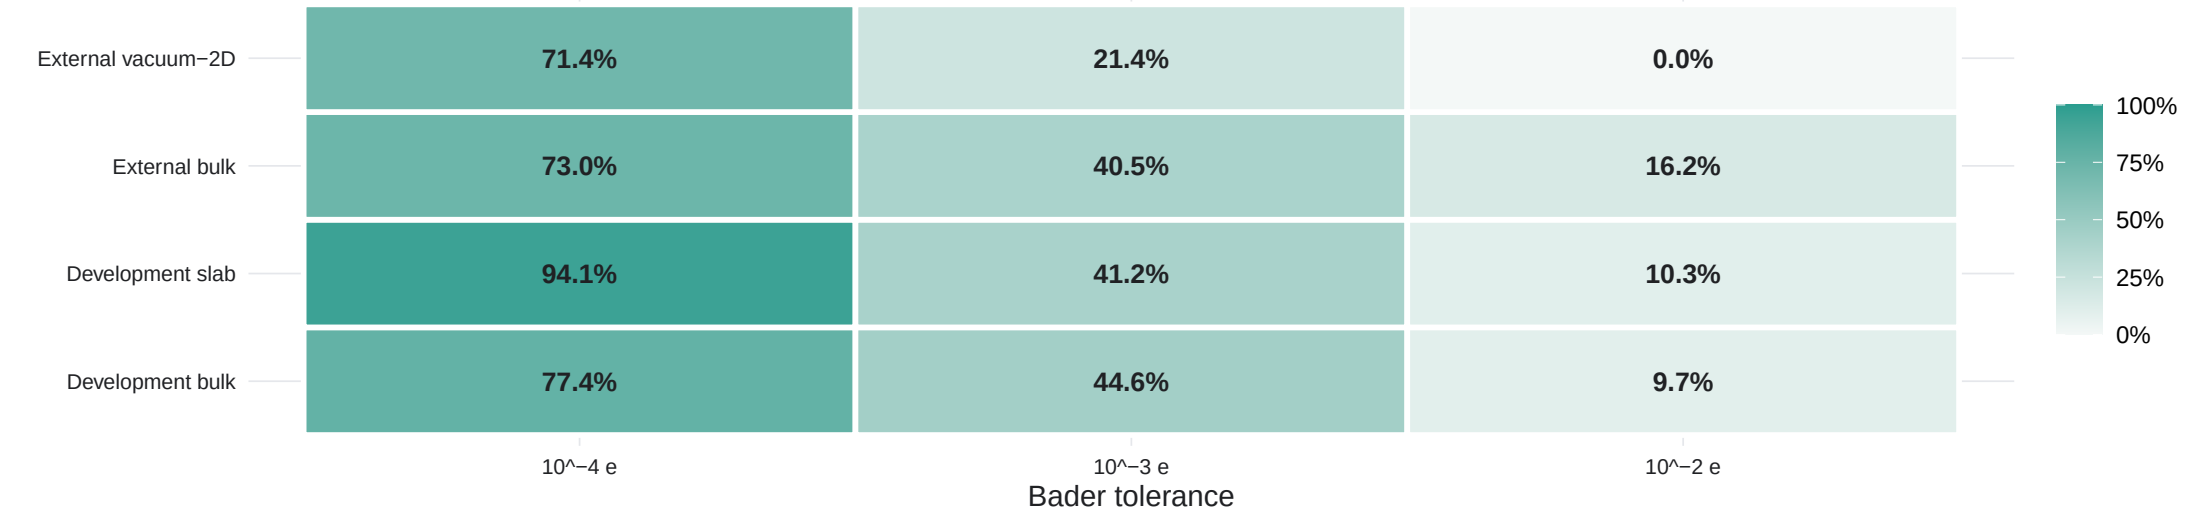

Paired material-level floors; n = 254

Overall 319-system non-evaluable fraction

C | Numerical eligibility is material- and tolerance-dependent

Protocol A.1; the structural-class contrast is not universal

A. Paired archived and A.1 stability floors. B. Overall non-evaluable fractions at the three chemical contracts. C. A.1 non-evaluable fractions by analysis stratum. Non-evaluable means the reference Bader QoI is not independently resolved.
