

Supplementary Figure S1 | QSQ defines the measurable Bader–fidelity landscape

The archived order–preserving float32 probe is provenance only; all current eligibility and certification use QSQ.

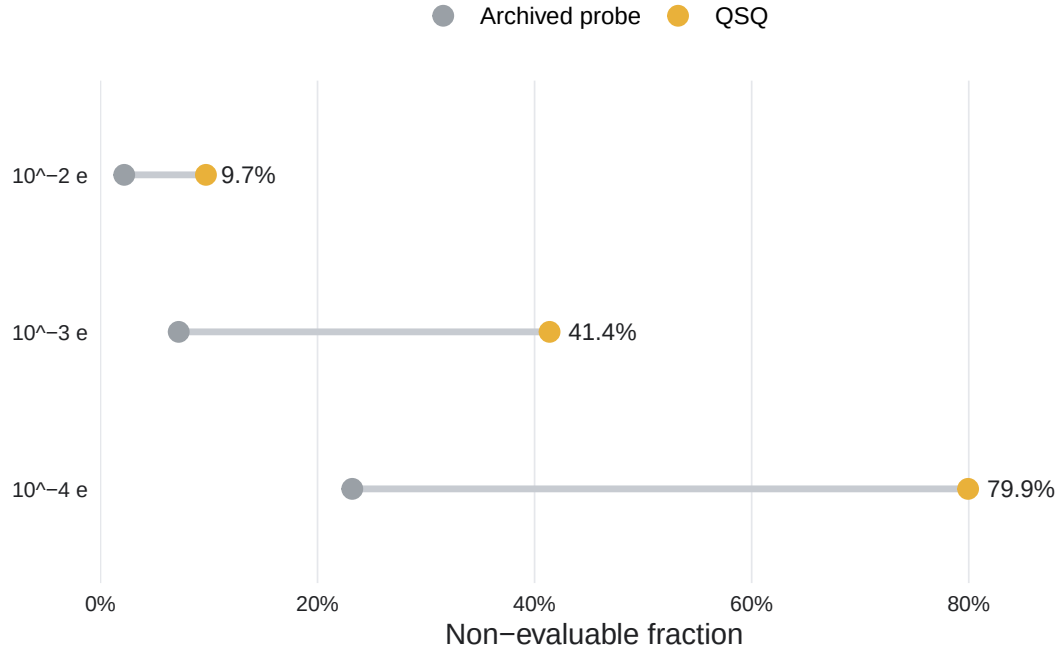

A | QSQ exposes substantially larger Bader instability

Paired archived float32–probe vs five–seed QSQ floors; n = 254

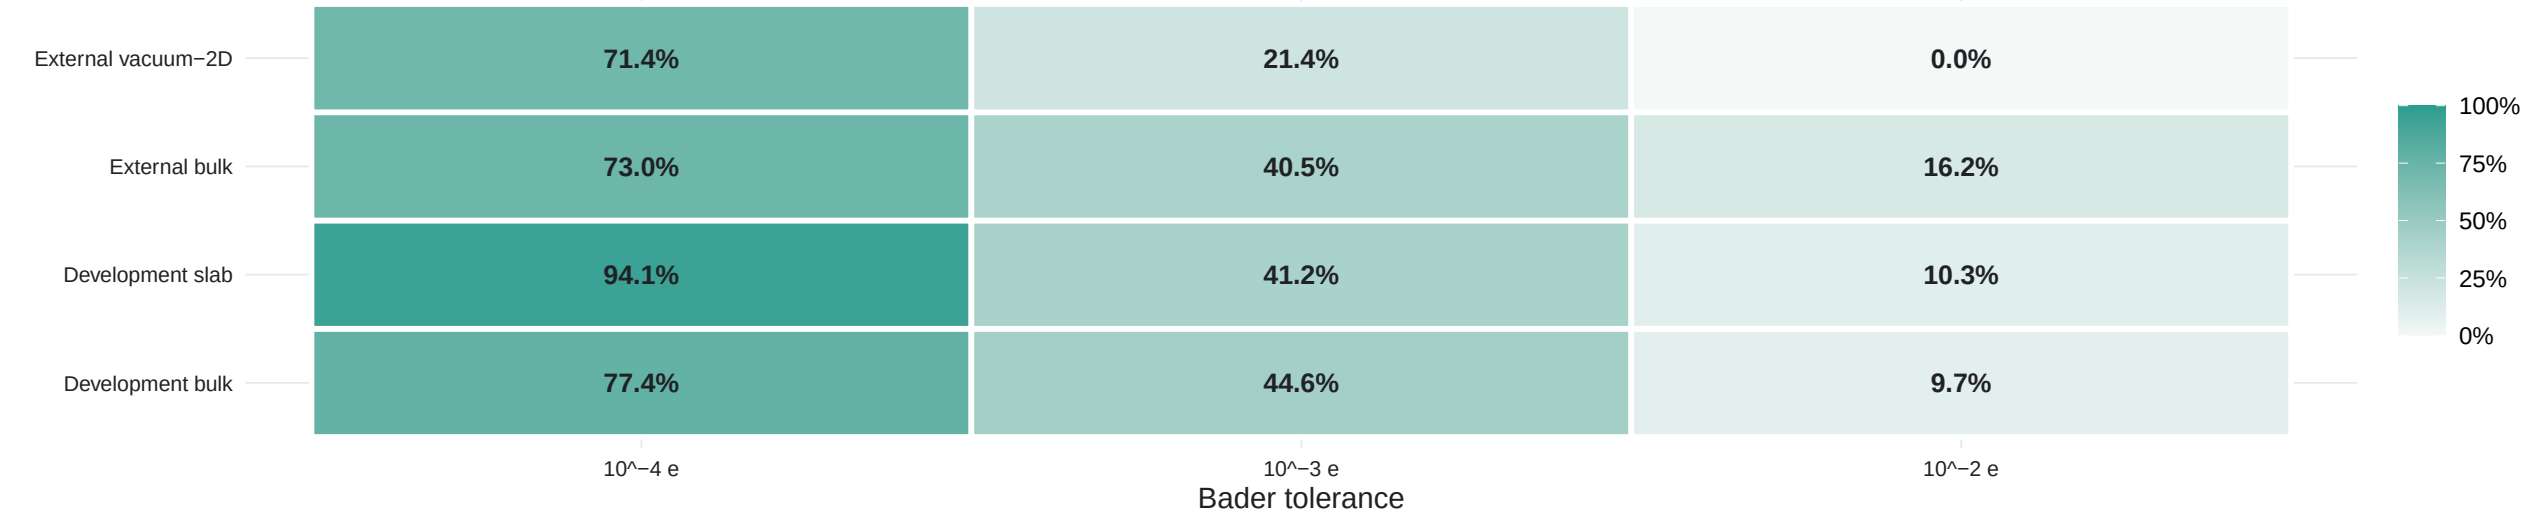

B | Stability qualification changes the non–evaluable rate

Overall 319–system stability universe

C | Numerical eligibility is material– and tolerance–dependent

QSQ; the structural–class contrast is not universal

A, paired archived and QSQ floors. B, overall non–evaluable fractions. C, QSQ rates by analysis stratum. Non–evaluable is neither codec pass nor codec failure.
