

Figure 5 | Topology-induced amplification explains irregular Bader response

re-solved Bader error = integrand perturbation + topology-driven domain migration

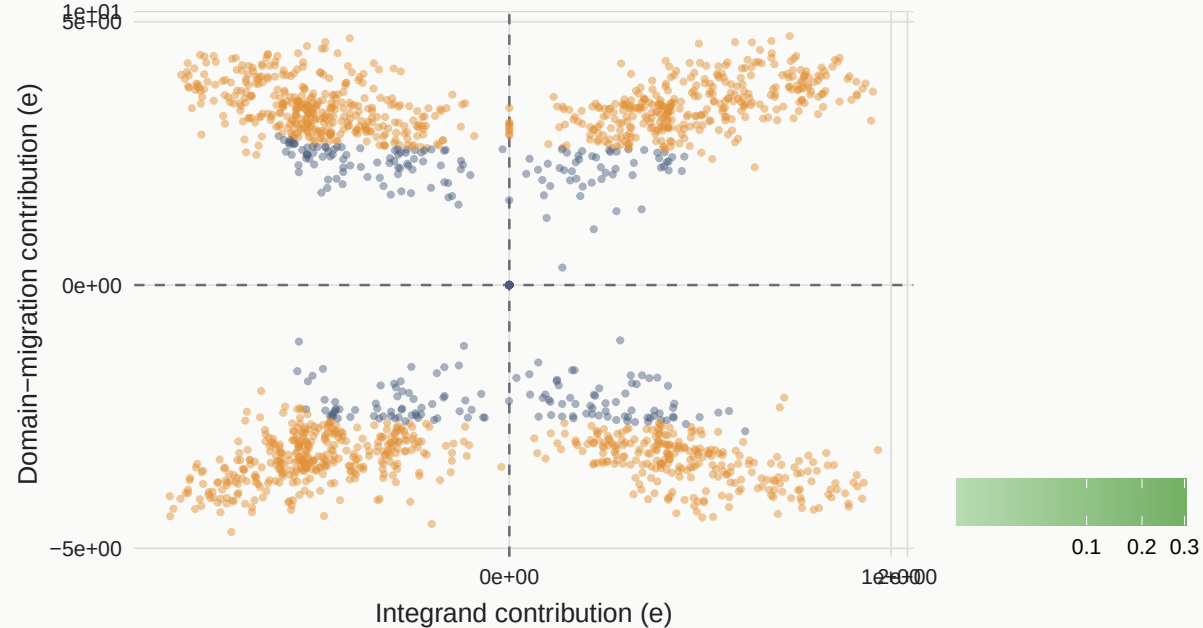

A | Re-solving the basins can amplify fixed-basin perturbation

Representative mechanism corpus; identity line marks equal integrand-only and total error

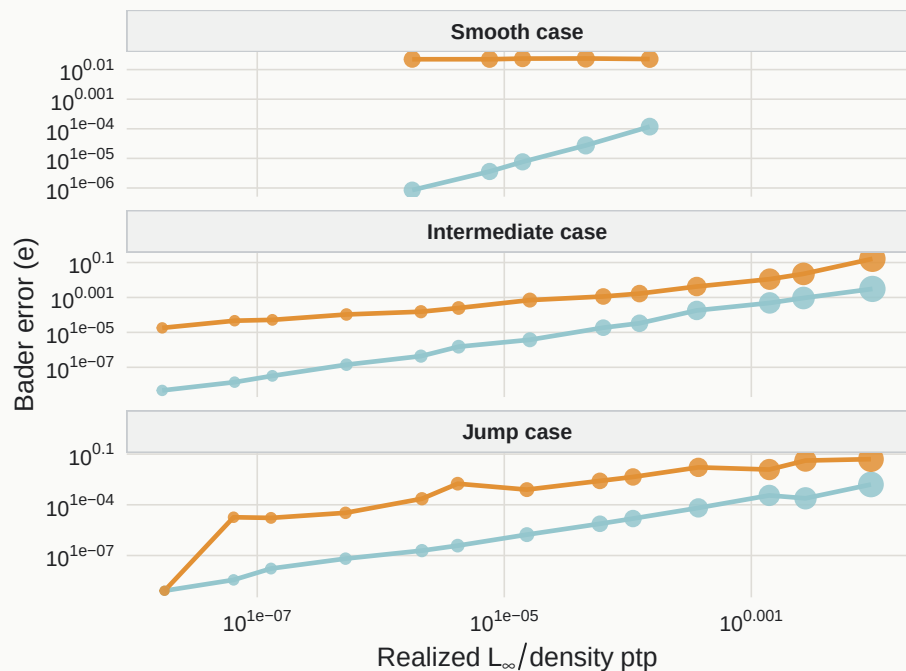

B | Large atomic deviations expose the domain-migration term

$\Delta q_{\text{total}} = \Delta q_{\text{integrand}} + \Delta q_{\text{domain}}$

C | Representative ladders separate smooth integrand change from abrupt basin reassignment

Point size encodes the fraction of voxels reassigned by the Bader partition

D | Run-to-run basin reassignment accompanies larger rung-to-rung Bader jumps

Full frozen benchmark; trend is descriptive association, not a causal fit
